

Math 113: Functional Analysis

Sair Shaikh

April 16, 2025

Defn. Let $\{U_\alpha\}_{\alpha \in A}$ be an open cover of (X, ρ) . We say that $d > 0$ is a Lebesgue number for the cover if given any d -ball $B_d(x_0)$ with $x_0 \in X$, there exists $a_0 \in A$ such that $B_d(x_0) \subseteq U_{a_0}$.

Ex $X = \mathbb{R}$. $U_1 = (-\infty, 1)$, $U_2 = (0, 2)$, and $U_3 = (1, \infty)$. Here $d = 1/2$ is a LN for $\{U_1, U_2, U_3\}$. This is clear if $x_0 \in (1/2, 3/2)$.

Ex. (Hwk.) Given $x \in (0, 1)$, $\exists \delta_x > 0$ such that:

$$y \in B_{\delta_x}(x) = \{y \in (0, 1) : |y - x| \leq \delta_x\}$$

$$\implies |1/x - 1/y| < 1$$

Then,

$$(0, 1) = \bigcup_{x \in (0, 1)} B_{\delta_x}(x)$$

has no Lebesgue number.

Lemma (Lebesgue Covering Lemma) Every open cover of a compact metric space has a Lebesgue number.

Proof. Pictures. Apr 9.

Thm. Suppose (X, ρ) is compact, and $F : (X, \rho) \rightarrow (Y, \sigma)$ is continuous. Then F is uniformly continuous.

Defn. Let (X, ρ) be a metric space and $C(X)$ the \mathbb{C} -vector space of continuous functions on X . We say $\mathcal{J} \subset C$ is equicontinuous at $x \in X$ if $\forall \epsilon > 0, \exists \delta > 0$ such that:

$$\forall F \in \mathcal{J}, F(B_\delta(x)) \subseteq B_\epsilon(F(x))$$

We say \mathcal{J} is equicontinuous on X if $\forall x \in X$, \mathcal{J} is equicontinuous at x .

Ex. Let $X = [0, 1] \subset \mathbb{R}$. Let $F_n(x) = x^n \forall n \geq 1$. Let:

$$\mathcal{J} = \{F_n : n \in \mathbb{N}\}$$

Let $x_n = \frac{1}{2}^{1/n}$. Then, x_n arrow up to 1. Then,

$$|F_n(x_n) - F_n(1)| = |1/2 - 1| = 1/2$$

Thus, \mathcal{J} is not equicontinuous at 1.

Ex. (Hwk) Show that \mathcal{J} is equicontinuous on $[0, 1)$.

Defn. Let (F_n) be a sequence of (\mathbb{C} -valued) functions on X . Then, (F_n) is uniformly bounded if $\exists M > 0$ such that $\forall n \geq 1, \forall x \in X$:

$$|F_n(x)| < M$$

We say that (F_n) is pointwise bounded if $\forall x \in X, \exists M_x > 0$ such that:

$$|F_n(x)| < M_x$$

Defn. A metric space (top. space) is seperable if there is a countable dense subset $D \subset X$.

Ex. Since $\mathbb{Q}^n \subset \mathbb{R}^n$ is dense, $(\mathbb{R}^n, \|\cdot\|_p)$ is separable.

Lemma. (Arzelà-Ascoli) Let (X, ρ) is a seperable metric space and that (F_n) is pointwise bounded and equicontinuous in $C(X)$. Then, there is subsequence (F_{n_k}) such that:

$$\lim_{x \rightarrow \infty} F_{n_k}(x)$$

exists $\forall x \in X$.

Yap. Given a sequence (x_n) , we get subsequence by finding $n_k \in \mathbb{N}$ such that $n_{k+1} > n_k$ and $(x_{n_k})_{k=1}^{\infty} \rightarrow x$ is a sequence.

A subsubsequence is determined by finding $n_{k_1} < n_{k_2} < \dots$ and then we write:

$$(x_{n_{k_j}})_{j=1}^{\infty}$$

A subsequence is determined by an infinite subset $S_1 = \{n_1 \leq n_2 \leq \dots\} \subset \mathbb{N}$. A subsubsequence is determined by an infinite subset $S_2 \subset S_1$,

$$S_2 = \{n_{k_1} < n_{k_2} < \dots\} \subset S_1$$

Now, we write:

$$\lim_{n \in S_1} x_n = a \text{ instead of } \lim_{k \rightarrow \infty} x_{n_k}$$

Note that $\lim_{n \in S_1} x_n = a$ if:

$$\forall \epsilon > 0 \exists N : n \geq N, n \in S' \implies |x_n - a| < \epsilon$$

Rmk. Suppose $S_1 \subset \mathbb{N}$ determines a subsequence as above. Suppose $S' \subset \mathbb{N}$ is infinite and:

$$\{n \in S' : n \notin S_1\}$$

is finite. The $\lim_{n \in S_1} x_n = a$ then $\lim_{n \in S'} x_n = a$ as well.

Proof of the AA Lemma: Pictures. Apr 9 and 10.

Rmk. If X is compact, then $C(x) = C_b(X)$ is a complete metric space with respect to the uniform norm $\|\cdot\|_\infty$.

Thm. (Arzelà-Ascoli) Let (X, ρ) be a compact metric space and $(F_n) \subset C(X)$ be a sequence of functions that are point-wise bounded and equicontinuous. Then (F_n) has a subsequence converging uniformly to some function $F \in C(X)$. Proof. Pictures.

Lemma. Suppose X is compact and that $\mathcal{J} \subset C(X)$ is equicontinuous on X . Then, \mathcal{J} is uniformly equicontinuous on X , in that for all $\epsilon > 0 \exists \delta > 0$ such that for all $x, y \in X$ and all $F \in \mathcal{J}$,

$$\rho(x, y) < \delta \implies |F(x) - F(y)| < \epsilon$$

Rewriting,

$$F(B_\delta(x)) \subseteq B_\epsilon(F(x))$$

Proof left as homework.

Corr. Let X be a compact metric space. Let $\mathcal{J} \subset C(X)$ be a closed subset such that \mathcal{J} is equicontinuous and pointwise bounded. Then \mathcal{J} is compact and uniformly bounded.

Thm. Suppose X is a compact metric space. Then $\mathcal{J} \subset C(X)$ is compact if and only if \mathcal{J} is closed, uniformly bounded, and equicontinuous on X . Proof. Pictures.

Defn. A topological space is called a Baire space if the countable intersection of dense open sets is dense.

Rmk. If ρ and σ are equivalent metrics on X then (X, ρ) is a Baire space if and only if (X, σ) is a Baire space.

Defn. If $S \subset X$ then the interior of S is:

$$Int(S) = \bigcup \{U \subset S : U \text{ is open in } X\}$$

Rmk. One can write $Int_X(S)$ as interior of S in X . Where you take the interior matters.

Lemma. A space X is a Baire space if and only if given a countable $\{F_n\}_{n=1}^\infty$ of closed sets, such that:

$$\bigcup_{n=1}^\infty F_n$$

has non-empty interior, then at least one F_n has (non-empty) interior.

Hwk. Write $O_n = F_n^C = X \setminus F_n$. O_n dense $\iff \text{Int}(F_n) = \emptyset$.

Thm. Baire Category Thm. Every complete metric space is a Baire space.

Rmk. Note that $(0, 1)$ is homeomorphic to \mathbb{R} . Hence, $(0, 1)$ is a Baire space.

Hwk. More generally, every non-empty open subset V of a complete metric space admits an equivalent complete metric (Hwk). Hence V is a Baire space. Thus, if:

$$V = \bigcup_{n=1}^{\infty} V \cap F_n$$

of each F_n closed in X , thus $V \cap F_n$ is closed in V . Hence, at least one $V \cap F_n$ has non-empty interior in V . But V is open, so it has interior in X .

Thm. Suppose that X is a Baire space and that $(F_n) \subset C(X)$ such that $F_n \rightarrow F$ pointwise. Then,

$$A = \{x \in X : F \text{ is cts at } x\}$$

is dense in X .

Proof. Pictures.

Rmk. If $X = \mathbb{R}$, then we can assume:

$$A = \{x \in X : F \text{ is cts at } x\}$$

is uncountable.

Defn. A normed vector space $(V, \|\cdot\|)$ is called a Banach space if V is complete in the induced metric. Recall that \mathbb{F} is always \mathbb{C} or \mathbb{R} .

Yap. Normed vector spaces are special.

1. $B_r(x) = x + B_r(0)$. The topology is homogenous.
2. $|||v|| - ||w||| \leq ||v - w|| \implies v \rightarrow ||v||$ is continuous.
3. $\overline{B_r(v)} = \{x \in V : ||x - v|| \leq r\}$.
4. $\epsilon B_r(0) = B_{\epsilon r}(0)$.
5. $\overline{\epsilon B_r(0)} = \overline{B_{\epsilon r}(0)}$.

Thm. Supposed that X and Y are normed vector spaces and $T : X \rightarrow Y$ is linear. Then, the following are equivalent:

1. T is continuous.
2. T is continuous at a single point.
3. $\exists \alpha \geq 0$ such that $||T(x)|| \leq \alpha ||x||$ for all $v \in X$.

Proof.

(1) \implies (2) is trivial.

(2) \implies (3). Since T is continuous at x_0 , $\exists \delta > 0$ such that:

$$T(\overline{B_\delta(x_0)}) \subset B_1(T(x_0))$$

LHS = $T(B_\delta(x_0)) + T(x_0)$.

RHS = $B_1(0) + T(x_0)$.

This implies, $T(\overline{B_\delta(0)}) \subset B_1(0)$.

Now if $z \neq 0$,

$$\|T(z)\| = \left\| \frac{\|z\|}{\delta} T\left(\delta \cdot \frac{z}{\|z\|}\right) \right\| \leq \frac{\|z\|}{\delta}$$

Let $\alpha = \frac{1}{\delta}$.

(3) \implies (1). Erased.

Rmk. Suppose that $\|\cdot\|_1$ and $\|\cdot\|_2$ (two different norms) induce equivalent metrics on V . Then, take the id : $(V, \|\cdot\|_1) \rightarrow (V, \|\cdot\|_2)$ is continuous (same topology). Hence, $\exists c \geq 0$ such that:

$$\|x_2\| \leq c \cdot \|x_1\|$$

Clearly, that means $c > 0$. By symmetry, there exists a $d > 0$, such that:

$$\|x_1\| \leq d \cdot \|x_2\|$$

Thus, the metrics and the norms are strongly equivalent.

Defn. If X and Y are normed vector spaces, then $\mathcal{L}(X, Y)$ is the vector space of continuous linear maps $T : X \rightarrow Y$. Define $\|T\| = \sup_{\|x\| \leq 1} \|T(x)\|$. If $X = Y$, then we write $\mathcal{L}(X)$ instead of $\mathcal{L}(X, X)$.

Lem. With $\|T\|$ as above, $\mathcal{L}(X, Y)$ is a normed vector space with:

$$\|T(x)\| \leq \|T\| \|x\| \forall x \in X$$

If $S \in \mathcal{L}(Y, Z)$, then we write ST in place of $S \circ T$ and:

$$\|ST\| \leq \|S\| \|T\|$$

Defn. An algebra over \mathbb{F} is a vector space A over \mathbb{F} with a ring structure, with $\lambda(xy) = (\lambda x)y = x(\lambda y)$ for all $\lambda \in \mathbb{F}$ and $x, y \in A$.

Ex. $M_n(\mathbb{F})$, $\mathbb{R}[x]$, $\mathbb{C}[x]$, $C(X)$.

Defn. If $\|\cdot\|$ is a norm on an algebra A , then we call $(A, \|\cdot\|)$ a normed algebra if $\forall x, y \in A$:

$$\|xy\| \leq \|x\| \|y\|$$

We call $(A, \|\cdot\|)$ a Banach algebra if $(A, \|\cdot\|)$ is a normed algebra and A is complete with respect to $\|\cdot\|$.

Prop. If X and Y are normed vector spaces, and Y is a Banach space, then $\mathcal{L}(X, Y)$ is a Banach space. If X is a Banach space, then $\mathcal{L}(X)$ is a Banach algebra.

Proof. Suppose that (T_n) is a Cauchy sequence in $\mathcal{L}(X, Y)$. Then, for each $z \in X$, $T_n(z)$ is a Cauchy sequence in Y . Hence $\exists T(z) \in Y$ such that:

$$T_n(z) \rightarrow T(z)$$

It is not hard to see that $T : X \rightarrow Y$ is linear.

Since (T_n) is Cauchy in norm, its bounded i.e. $\exists M > 0$ such that:

$$\|T_n\| \leq M \forall n \geq 1$$

Now if $\|x\| \leq 1$, then:

$$\|T(x)\| = \lim_{n \rightarrow \infty} \|T_n(x)\| \leq \limsup_n \|T_n\| \|x\| \leq M \|x\|$$

This implies $T \in \mathcal{L}(X, Y)$.

Let $\epsilon > 0$. Let N be such that $m, n \geq N$. Thus,

$$\|T_n - T_m\| \leq \frac{\epsilon}{2}$$

Now if $\|x\| \leq 1$, and if $n \geq N$,

$$\begin{aligned} \|(T - T_n)(x)\| &= \|T(x) - T_n(x)\| \\ &= \lim_{m \rightarrow \infty} \|T_m(x) - T_n(x)\| \\ &\leq \limsup_m \|T_m - T_n\| \cdot \|x\| \\ &\leq \frac{\epsilon}{2} < \epsilon \end{aligned}$$

Yap. Let $Y \subset X$ be a subspace of a normed vector space X . Then we can form the quotient vector space $X/Y = \{x + Y : x \in X\}$ with $q : X \rightarrow X/Y$ the quotient map.

If $x \in X$, then:

$$\inf\{\|x - y\| : y \in Y\}$$

depends only on $q(x)$. We call:

$$\|q(x)\| := \inf\{\|x - y\| : y \in Y\}$$

the quotient norm on X/Y .

Rmk. As Y is a subspace,

$$\begin{aligned} \|q(x)\| &= \inf\{\|x + y\| : y \in Y\} \\ &= \inf\{\|x + \alpha y\| : y \in Y\} \forall \alpha \in \mathbb{F} \setminus \{0\} \end{aligned}$$

Thm. If Y be a subspace of $(X, \|\cdot\|)$. Then,

$$\|q(x)\| = \inf\{\|x - y\| : y \in Y\}$$

is a seminorm on X/Y which is a norm exactly when Y is closed. If X is a Banach space, and Y is closed in X , then X/Y is a Banach space.

Proof. Note that for $\alpha \neq 0$:

$$\|\alpha q(x)\| = \|q(\alpha x)\| = \inf\{\|\alpha x + \alpha y\| : y \in Y\} = |\alpha| \inf\{\|x + y\| : y \in Y\} = |\alpha| \|q(x)\|$$

Next, fix $x_1, x_2 \in X$. Then given $\epsilon > 0$, $\exists y_1, y_2 \in Y$ such that:

$$\begin{aligned} \|q(x_1)\| + \|q(x_2)\| + \epsilon &\geq \|x_1 - y_1\| + \|x_2 - y_2\| \\ &\geq \|x_1 - y_1 + x_2 - y_2\| \\ &\geq \|q(x_1 + x_2)\| \\ &= \|q(x_1)\| + \|q(x_2)\| \end{aligned}$$

Since $\epsilon > 0$ is arbitrary, $\|q(x_1) + q(x_2)\| \leq \|q(x_1)\| + \|q(x_2)\|$. Thus, it is a semi-norm. Sketch for closed. If quotient norm is 0, there exists a sequence y_n converging to x . If Y closed, $x \in Y$ and $q(x) = 0$. Conversely, if quotient norm is a norm and $y_n \rightarrow x$. Then, $\|q(x)\| = 0$. Then, $q(x) = 0$ and $x \in Y$.

Now suppose X is a Banach space and Y is closed in X . Let $(q(z_0))$ be Cauchy in X/Y . Then we can pass to a subsequence and assume:

$$\|q(z_{n+1}) - q(z_0)\| \leq 1/2^n$$

Let $x_1 = z_1$. Since:

$$\|q(z_2) - q(x_1)\| < 1/2$$

Thus,

$$\inf\{\|z_2 - x_1 - y\| : y \in Y\} < 1/2$$

Hence, we can find x_2 such that $q(x_1) = q(z_2)$ and

$$\|x_2 - x_1\| < 1/2$$

Continuing, we get (x_n) such that $q(x_n) = q(z_n)$ and:

$$\|x_{n+1} - x_n\| < 1/2^n$$

(Hwk) (x_n) is Cauchy, thus, $x_n \rightarrow x$ in X .

But $\|q(z)\| \leq \|z\|$. Hence, q is continuous. Thus,

$$q(z_n) = q(x_n) \rightarrow q(x)$$

Rmk. Note that $q : X \rightarrow X/Y$ is a bounded linear map of norm at most 1.

Thm. Suppose that Y is a closed subspace of $(X, \|\cdot\|)$. Then X is a Banach space if and only if both Y and X/Y are Banach spaces.

Proof. Pictures. 4/16

Thm. Every finite-dimensinal subspace Y of a normed vector space X is a Banach space and hence closed in X . If $\dim(Y) = n$, then every linear isomorphism $\Phi : \mathbb{F}^n \rightarrow Y$ is a homeomorphism.

Proof. Pictures. 4/16.
